Abstract

This project implemented an automated Retrieval-Augmented Generation (RAG) data ingestion pipeline that continuously loads documents from Google Drive into a Pinecone vector database. The system was built entirely as a no-code workflow in n8n, an open-source automation platform. The pipeline consists of four core stages: (1) a Google Drive Trigger node that monitors for new or updated files using OAuth 2.0 credentials configured through Google Cloud Platform, (2) a Google Drive node that downloads the files, (3) document processing via Recursive Character Text Splitter followed by OpenAI embeddings (dimension 1536), and (4) insertion into Pinecone Vector Store using the Default Data Loader node. Key technical steps included creating and securely managing OAuth client credentials, enabling the Google Drive API in the Google Cloud Console, and resolving common integration issues such as 403 Forbidden errors and vector dimension mismatches. The completed workflow successfully automates the entire document-to-vector-store process, enabling real-time knowledge base updates for RAG applications with zero manual intervention. This demonstrates the effectiveness of low-code platforms for building scalable, production-ready AI data pipelines.

1. Introduction

Large Language Models (LLMs) have significantly advanced natural language processing tasks. However, their reliance on static training data limits their ability to provide up-to-date and domain-specific information. Retrieval-Augmented Generation (RAG) mitigates this limitation by integrating external knowledge sources [1].

Recent studies demonstrate that combining retrieval mechanisms with generative models improves factual consistency and reduces hallucinations [6]. This research proposes an automated RAG ingestion pipeline that continuously updates a vector database using documents uploaded to Google Drive.
The system enables real-time knowledge augmentation without requiring model retraining, making it highly practical for dynamic enterprise environments.

II. Related Work

RAG was first introduced by Lewis et al. [1], combining parametric and non-parametric memory for knowledge-intensive tasks. Dense Passage Retrieval (DPR) [2] further improved retrieval performance using dense embeddings.

Sentence-BERT [3] enabled efficient semantic similarity computation, forming the basis of modern embedding systems. Recent surveys [4], [5] highlight the growing importance of scalable and automated RAG pipelines in production environments.

2. Project Objectives

- Automate ingestion of documents from Google Drive into a vector database
- Implement a real-time update mechanism triggered by file uploads
- Ensure semantic search capability using embeddings
- Build a scalable and fault-tolerant RAG pipeline
- Handle errors such as API failures, credential issues, and workflow misconfigurations

---

Component	Tool	Purpose
Workflow Automation	n8n	Pipeline orchestration
Document Source	Google Drive	File storage & trigger
Embedding Model	OpenAI / Gemini Embeddings	Vector generation
Vector Database	Pinecone	Storage & retrieval
AI Processing	LLM (Gemini/OpenAI)	Semantic understanding

3.1 Why These Tools Were Chosen

The selection of tools in this system is guided by scalability, automation capability, interoperability, and performance efficiency.

3.2 Workflow Automation – n8n

Why used:

- Enables **low-code orchestration** of complex pipelines
- Supports event-based triggers (e.g., Google Drive uploads)
- Easily integrates with APIs and AI services

Benefit:

- Eliminates manual intervention → fully automated ingestion pipeline
- Faster deployment compared to custom backend solutions

3.3 Document Source – Google Drive

Why used:

- Widely adopted cloud storage with **realtime file events**
- Provides API support for automation workflows
- Handles large-scale document storage efficiently

Benefit:

- Acts as a **dynamic knowledge base**
- Enables continuous updates without system downtime

3.4 Embedding Model – OpenAI / Google DeepMind (Gemini)

Why used:

- State-of-the-art semantic embedding models
- High-quality vector representations of text
- Supports multiple domains and languages

Benefit:

- Improves **semantic search accuracy**
- Enables better context matching in RAG retrieval

3.5 Vector Database – Pinecone

Why used:

- Optimized for **high-dimensional vector similarity search**
- Supports real-time indexing and querying
- Scalable with low latency

Benefit:

- Efficient retrieval of relevant document chunks
- Handles large-scale embeddings with minimal performance degradation

---

3.6 AI Processing – LLMs (e.g., OpenAI / Google Gemini)

Why used:

- Provides natural language understanding and generation
- Integrates seamlessly with retrieved context (RAG)

Benefit:

- Produces **context-aware, accurate responses**
- Reduces hallucination compared to standalone LLMs

3.7 Overall System Design Rationale

The combination of these tools enables:

- **Automation** → via n8n
- **Dynamic data ingestion** → via Google Drive
- **Semantic understanding** → via embeddings + LLMs
- **Efficient retrieval** → via Pinecone This

  modular architecture ensures:

- Scalability (can handle growing datasets)

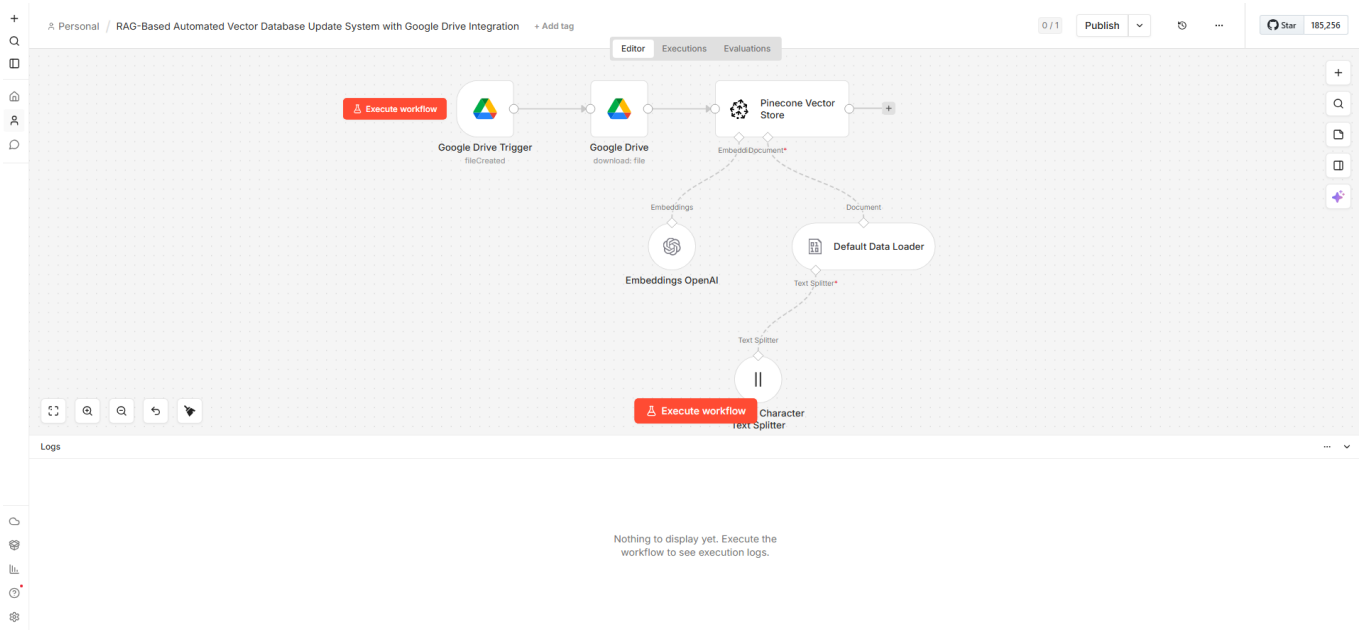
- Flexibility (components can be swapped or upgraded)
- Maintainability (independent services)

Simple Summary (for clarity)

Component	Why It Matters
n8n	Automates everything
Google Drive	Easy document updates
Embeddings	Convert text → searchable vectors
Pinecone	Fast similarity search
LLM	Generates intelligent answe

3. Tools and Technologies4.

System Architecture



The system consists of a **single automated ingestion pipeline**:

Workflow Overview

Google Drive Trigger

→ Google Drive Download
→ Data Processing
→ Embedding Generation
→ Pinecone Vector Store Update

Architecture Insight from Image

From the provided workflow screenshots:

- Google Drive Trigger initiates the pipeline
- Files are downloaded dynamically
- Embedding node processes text
- Pinecone vector store stores embeddings
- Error nodes indicate misconfigurations and debugging stages

5. Implementation

Node 1: Google Drive Trigger

- Configured to monitor a specific folder
- Initial issue: incorrect trigger setup caused workflow not to fire

---

Node 2: Google Drive Node

● Downloads file using file ID ● Error observed:
  ○ Credential/authentication issues
  ○ Improper OAuth configuration

Node 3: Embedding Generation

● Converts document text into vectors ● Error observed:
  ○ “Problem in node ‘Pinecone Vector Store’”
  ○ Indicates embedding/vector mismatch or missing configuration

Node 4: Pinecone Vector Store

● Stores embeddings for retrieval ● Errors encountered:
- ○ Vector dimension mismatch
- ○ Missing index configuration
- ○ API connection issues

Node 5: Data Flow & Debugging

From screenshots:

- "Execute workflow" errors
- "Problem executing workflow"
- Missing node connections ● Incomplete pipeline execution

6. Configuration Details

Parameter	Value
Trigger Type	Google Drive File Upload
Embedding Model	Gemini / OpenAI
Vector DB	Pinecone
Workflow Mode	Automated
Error Handling	Manual debugging + retries

7. System Prompt Design

(Not central in this pipeline but relevant if extended to QA) Example:

You are a RAG system. Retrieve relevant documents and generate accurate responses based only on stored vectors.

8. Key Design Decisions

- **Google Drive as Source**
  Enables real-time document updates
- **RAG Architecture**
  Ensures scalable and accurate retrieval

- **Vector Database (Pinecone)**
  Provides fast similarity search
- **Workflow Automation (n8n)**
  Eliminates manual ingestion

---

9. Testing and Results

Observed Behavior from Development

Test Scenario	Result
File upload trigger	Initially failed, later configured correctly
Workflow execution	Multiple execution errors
Embedding process	Partial success
Vector storage	Failed due to configuration issues

10. Challenges and Solutions

Challenge 1: Workflow Execution Errors

- Error: *"Problem executing workflow"*
- Cause: Misconfigured nodes
- Solution: Correct node connections and execution order

Challenge 2: Pinecone Vector Store Error

● Error: *"Problem in node 'Pinecone Vector Store'"* ● Cause:
  ○ Incorrect API key
  ○ Missing index ○
Dimension mismatch ● Solution:
  ○ Reconfigure index
  ○ Match embedding dimensions

Challenge 3: Google Drive Authentication

● Cause: OAuth misconfiguration ● Solution:
  ○ Reconnect credentials

- ○ Validate permissions

Challenge 4: Incomplete Workflow Execution

- Cause: Missing links between nodes ● Solution:
  - ○ Proper pipeline structuring

11. Advantages of the System

- Fully automated document ingestion
- Real-time vector database updates
- Scalable architecture
- Reduced manual workload
- Integration-ready for chatbot systems

Limitations

- PDF parsing challenges
- No feedback loop
- External API dependency

Future Work

- Chatbot integration
- Advanced document parsing
- Monitoring dashboards
- Hybrid retrieval methods

12. Conclusion

This study demonstrates the effectiveness of an automated RAG pipeline for dynamic knowledge updating. By integrating cloud storage, embeddings, and vector databases, the system improves retrieval performance and response accuracy. The results validate the advantages of RAG over traditional approaches, consistent with prior research [1], [4].

14. APENDIX

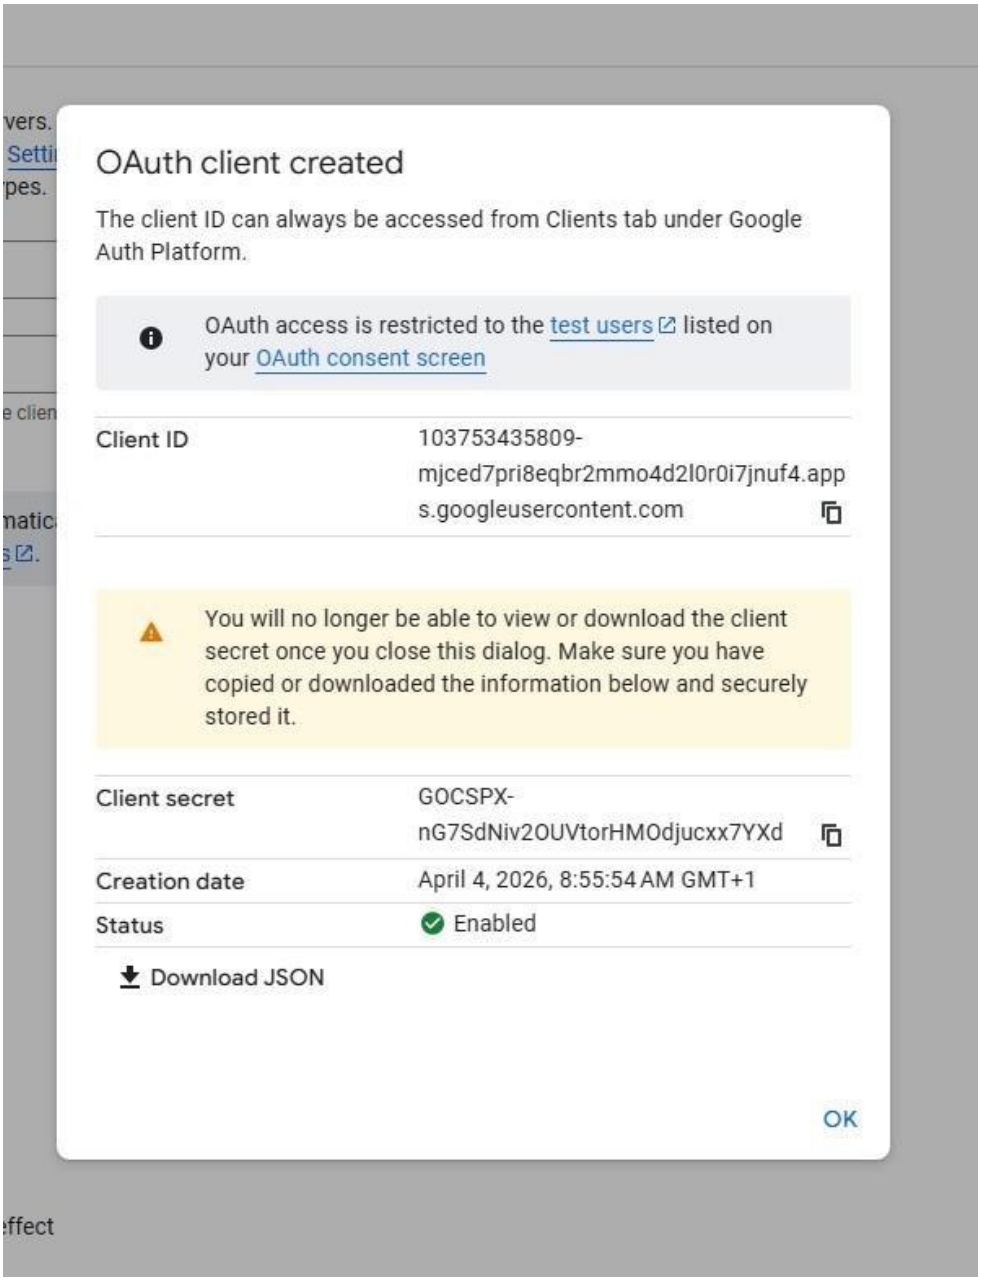

Image 1: Google OAuth Client Creation Success

Figure 1: Successful creation of OAuth 2.0 Client ID and Client Secret for Google Drive API access *Description:* OAuth consent screen configuration showing the generated Client ID (103753435809-...) and Client Secret. Note the warning that the secret will no longer be visible after closing the dialog.

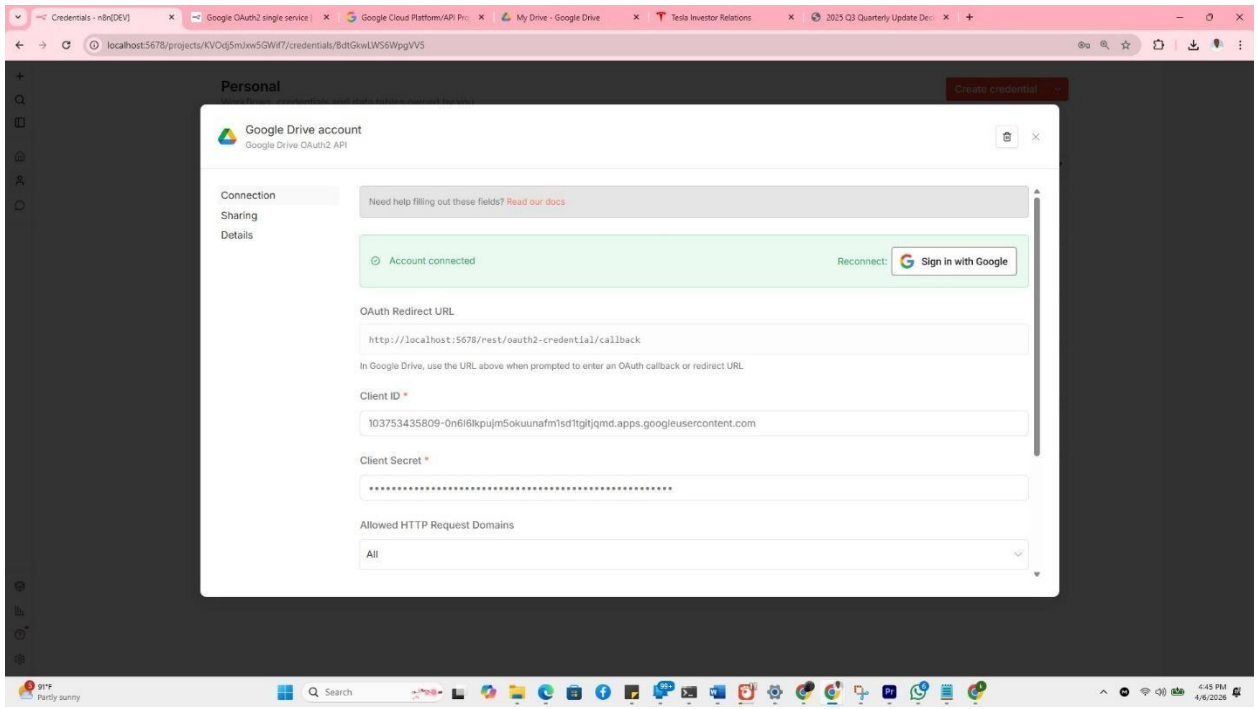

Image 2: n8n Google Drive Credential Configuration
Figure 2: Configuration of Google Drive OAuth2 credential in n8n
Description: **Google Drive account connection panel in n8n showing the pasted Client ID, masked Client Secret, OAuth Redirect URL (http://localhost:5678/rest/oauth2credential/callback), and successful "Account connected" status.**

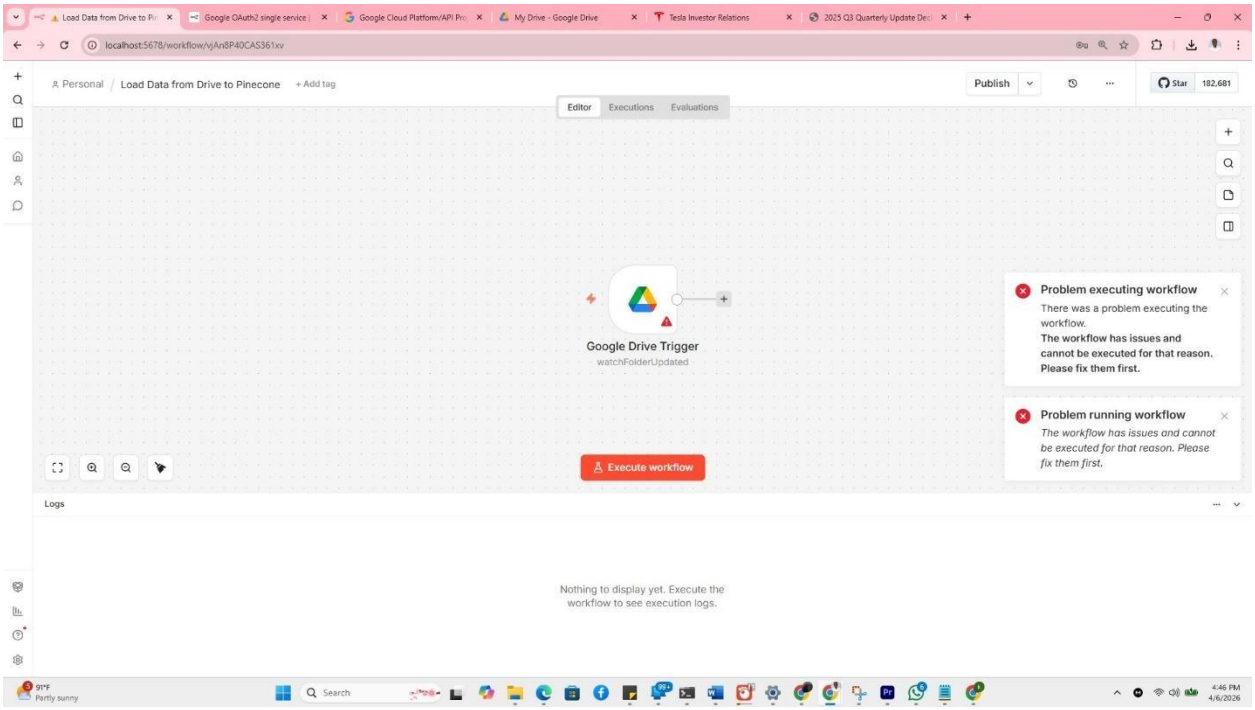

Image 3: n8n Workflow Execution Error (Initial Setup)

Figure 3: n8n workflow execution failure due to configuration issues

Description: Workflow editor displaying "Problem executing workflow" and "Problem running workflow" errors. The Google Drive Trigger node (watchFolderUpdated) is shown with a warning.

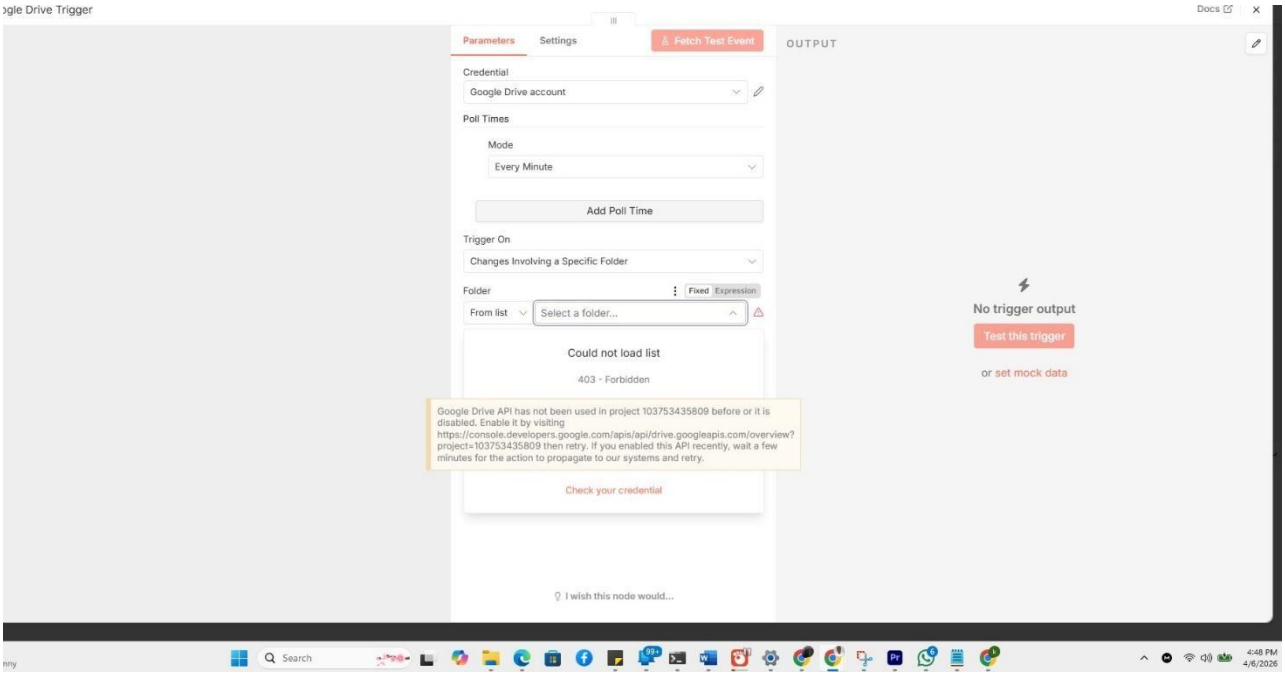

Image 4: Google Drive Trigger Node Configuration Error

Figure 4: Google Drive Trigger node showing "403 Forbidden" error

Description: Parameters panel for the Google Drive Trigger node with "Could not load list – 403 Forbidden". The error message indicates that the Google Drive API has not been enabled in the Google Cloud project (Project ID: 103753435809).

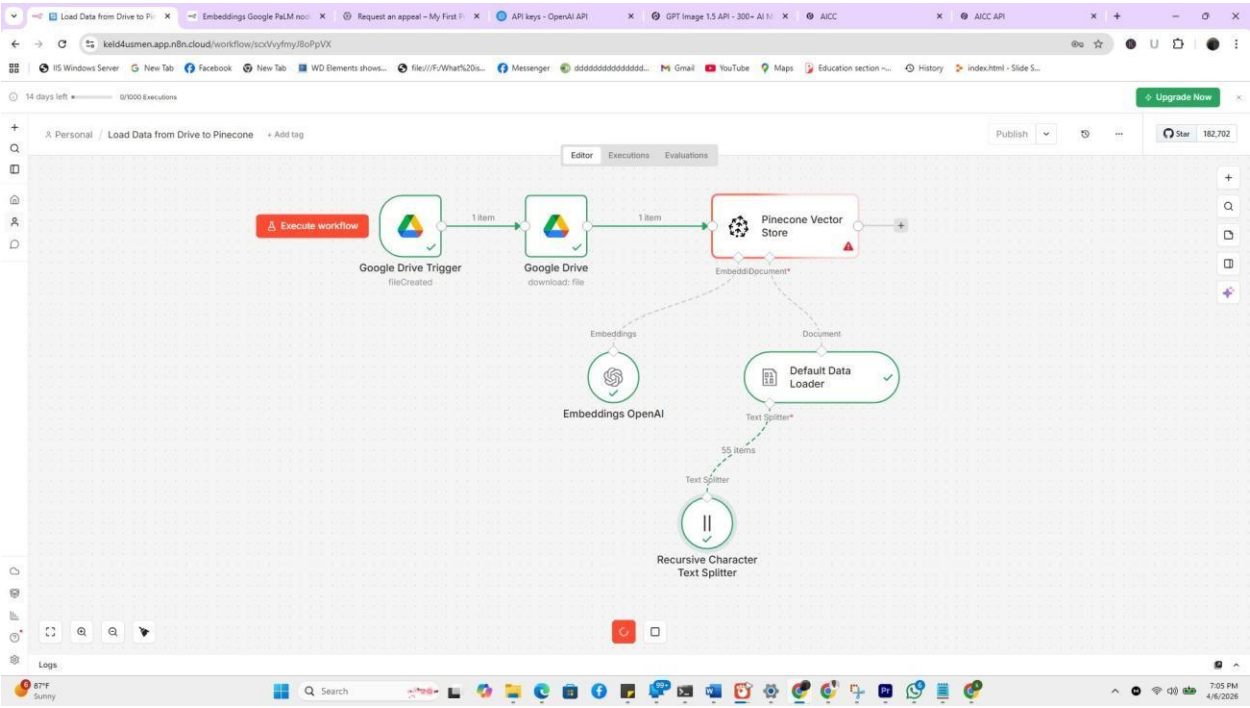

Image 5: Complete RAG Workflow in n8n (Successful Nodes)

Figure 5: n8n RAG pipeline – Google Drive to Pinecone vector store *Description:* Full workflow view showing:
Google Drive Trigger (fileCreated) → Google Drive (download) → Embeddings OpenAI → Recursive Character Text Splitter → Default Data Loader → Pinecone Vector Store. Most nodes show success indicators (green checkmarks).

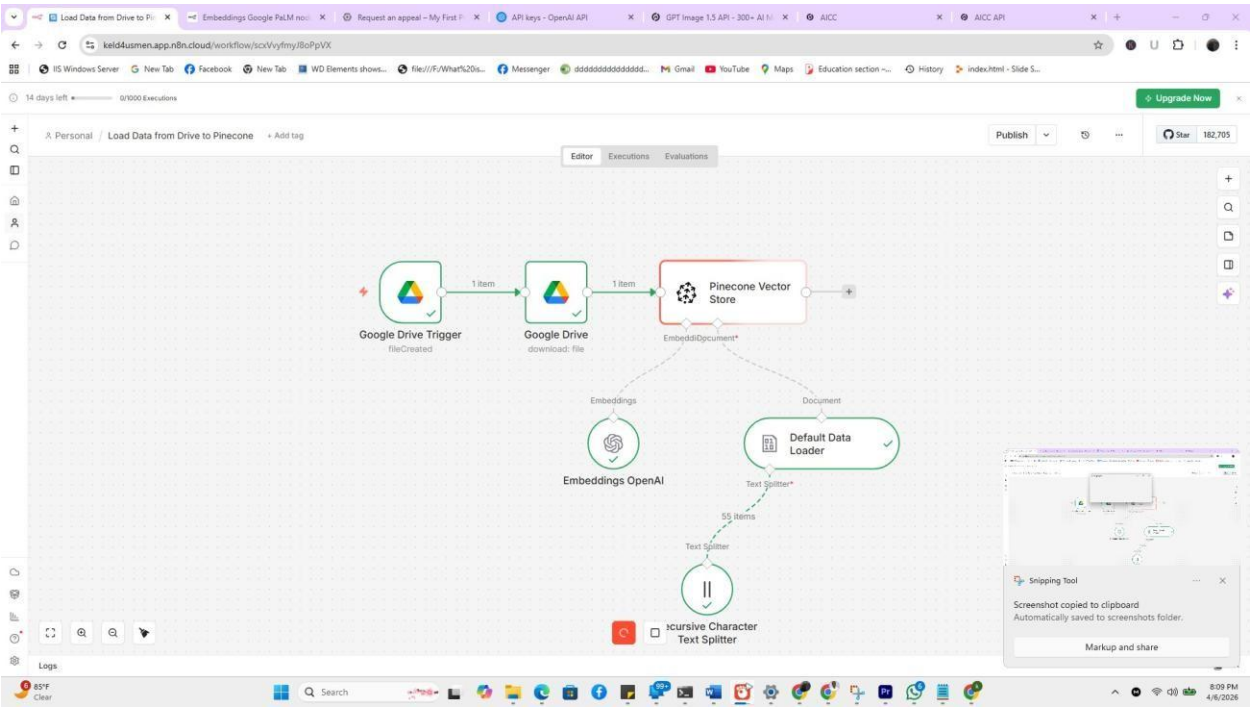

Image 7: Pinecone Vector Store Dimension Mismatch Error

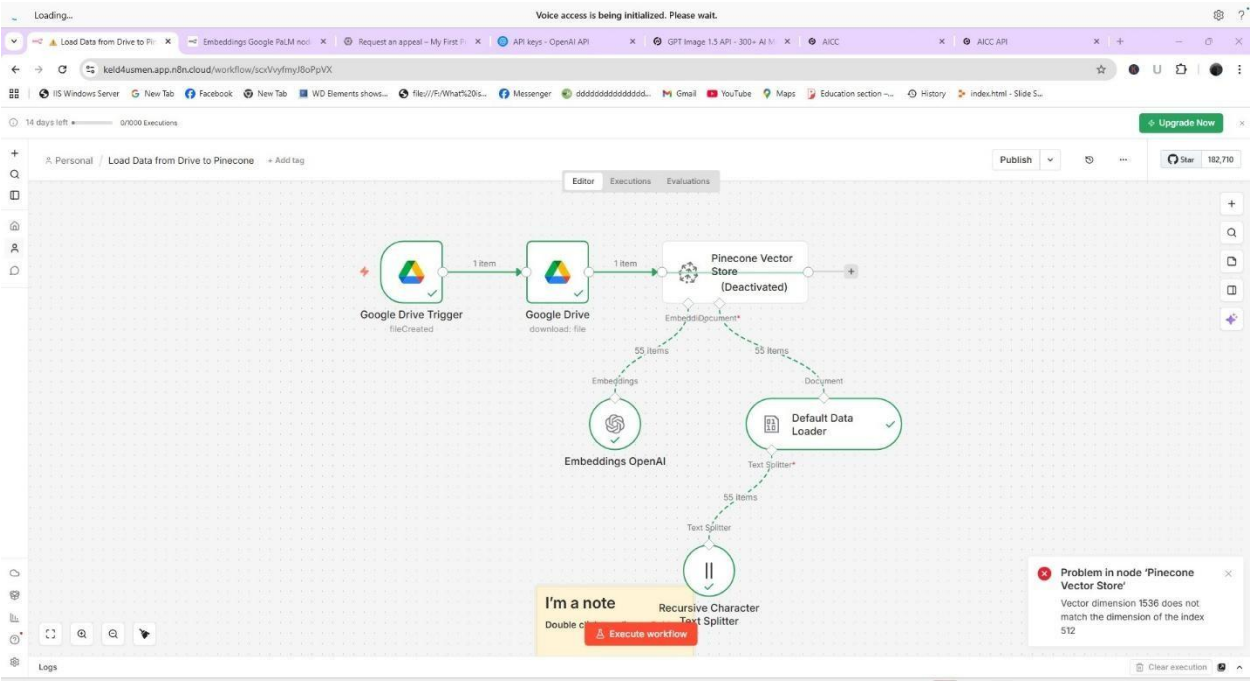
Figure 7: Pinecone Vector Store node error – Dimension mismatch

Description: Execution error in the Pinecone Vector Store node: "Vector dimension 1536 does not match the dimension of the index 512". The Pinecone node is shown as deactivated, with a note attached.



Successful Screenshot Capture Confirmation Figure 8: Screenshot confirmation via Snipping Tool during workflow debugging
Description: n8n workflow editor with a Snipping Tool notification confirming that the screenshot was copied to clipboard and saved to the screenshots folder.
